Example: based on 88 rows and 26 increases

1. Divide the # of rows to be worked by the # of inc. or dec. (# rows / (# inc. or dec.) = Rate)
   a. 88 rows / 26 inc. = 3.38 (this is the Rate).
2. Determine the two whole numbers that fall on either side of the Rate (the whole #'s are 3 and 4 based on a Rate of 3.38).
3. Take the decimal portion of the Rate (0.38 above) and subtract it from 1.00 to find the remainder (1.00 - .38 = .62 is the remainder).
4. Multiply the total # of inc. or dec. by each of the decimal portions in item 3.

   Step 1: 0.38 multiplied by 26 = 9.88
   0.62 multiplied by 26 = 16.12

   Step 2: Round these numbers to the nearest whole number (9.88 rounds to 10, and 16.12 rounds to 16).
